Kiril Dichev, Alexey Lastovetsky MPI vs BitTorrent: Large-Message Broadcasts

# Motivation

- All collectives in MPI are tree-based
  - On heterogeneous networks, efficient communication trees are needed
  - Construction of such communication trees complex
  - Tree-based collectives make sense for small messages
  - ... But we question them for large messages
- **Objective**: Minimize the total runtime of large-message broadcasts on heterogeneous networks
- **Approach**: Examine algorithms both from HPC and distributed computing

Ξ

## The MPI Way of Broadcasting Messages

- MPI always uses trees to schedule a broadcast
- Examples of trees: flat, linear or binomial tree

# Complexity for Small-Message Broadcasts

- Process number N and message size M determine complexity
- Typical broadcast complexity:
  - O(M \* log(N)) (binomial tree)
  - O(M \* N) (linear/flat tree)

イロト イポト イヨト イヨト

# Pipelining in Large-Message MPI Broadcasts

- Complexity differs for large M and moderate N: O(M)
- Reason: Pipelining of fragmented message
- Related research <sup>1</sup>:
  - Trees with small nodal degree best for pipelined broadcasts
  - Linear tree is best tree-based algorithm

# Outline

#### (2) Using BitTorrent for Broadcasts

Ξ

# Overview of BitTorrent Protocol

- Protocol invented by Bram Cohen<sup>2</sup>
- Various objectives related to peer-to-peer systems high-performance not central
- Non-determinism, randomness, and unpredictability
- Hard to analyze complexity
- Early efforts rely on practical observations
- Some work<sup>3</sup> suggests complexity O(M) in wide-area networks

<sup>2</sup>Cohen, B.: Incentives build robustness in BitTorrent (2003) <sup>3</sup>Izal, M., Urvoy-Keller, G., Biersack, E., Felber, P., Al Hamra, A., Garcs-Erice, L.: Dissecting BitTorrent: Five months in a torrents lifetime.

# Outline

#### 3 Experiments and Results

Kiril Dichev, Alexey Lastovetsky MPI vs BitTorrent: Large-Message Broadcasts

Ξ

# Experimental Setup

- Original BitTorrent client written by Bram Cohen used
- Minor modifications (remove I/O and send dummy data, add simple profiling)
- BitTorrent clients used as MPI programs

・ロト ・回ト ・ヨト

# Experimental Setup (2)

- We use the Bordeaux clusters of Grid'5000 for our experiments
- 'Bordeplage' cluster is connected through bottleneck link to the other clusters:
  - Single 1 Gigabit link for all inter-cluster communication
  - · Larger latency through traversal of more switches

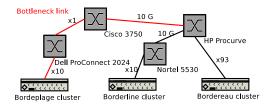

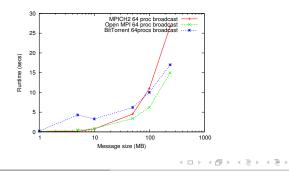

Figure: Topology of the Ethernet network on Bordeaux site

- ロト - (日下 - 王下 - 王下)

Results Single Cluster

- 64 nodes on a single cluster
- The linear tree algorithm holds its "promise" best algorithm
- BT is better than expected better than MPICH2 for messages larger than 50 MB

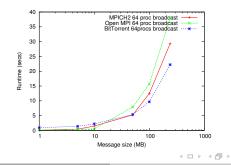

Kiril Dichev, Alexey Lastovetsky

MPI vs BitTorrent: Large-Message Broadcasts

#### Results Involving the Bottleneck Link

- 64 nodes across the 3 clusters (involving the single bottleneck link)
- As expected, all algorithms are slower
- Linear tree with less than half the original throughput
- BT is the best algorithm for message size of 50 MB or larger

# Pros of BitTorrent Compared to MPI

- Many parallel connections seem to improve the protocol
- Oblivious of network topology
- Near the optimal MPI algorithm for very large messages on homogeneous networks
- Better than MPI for messages larger than 50 MB on moderately heterogeneous networks
- BT results stable (all results show average, not minimum)

イロト イポト イヨト イヨト

# Contras of BitTorrent Compared to MPI

- High performance not the main objective of original protocol
- Good network utilization particular to large-message broadcasts
- Analysis of complexity is difficult

- ロト - (日下 - 王下 - 王下)

# Conclusion

- In this work, we prove that BitTorrent-based collectives can be used in HPC
- $\, \bullet \,$  In related work, we show that BitTorrent can solve other HPC-related problems as well  $^5$
